

# Wavefront sensors and adaptive optics for optical metrology, lasers and microscopy

**Optical Metrology Applications**

**Adaptive Optics for Laser Beam Control**

**Adaptive Optics Solutions for Microscopy**

**Optical metrology & adaptive optics for X-EUV**

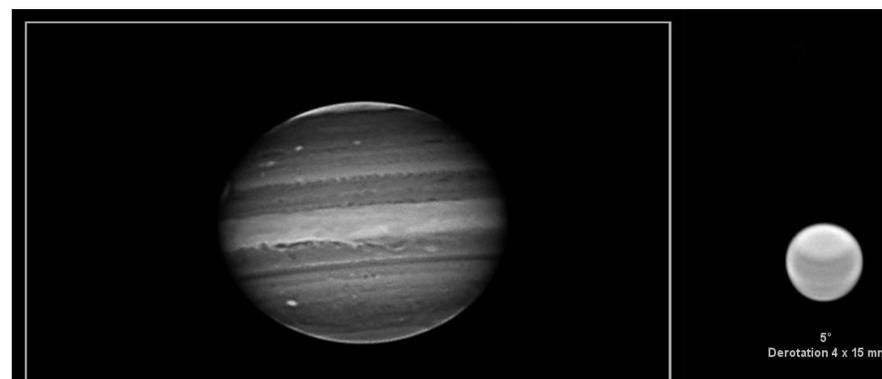

CIAO can now work  
on extended sources

# C ompact I nnovative A daptive O ptics

- The first goal is to add an active optics feature on the telescope to remove its static aberration (alignement, gravity, thermal...) *It is very often the main problem of 0.5 to 2m class telescopes*
- The second goal is to compensate the effect of the air turbulences and do adaptive optics . This technique allows increasing the exposure duration without losing any spatial resolution. For example : CH<sub>4</sub> measurements on Jupiter or Uranus

- The third goal is to increase the efficiency of the « lucky imaging technique » used by hobbyist astronomers

## Specifications

Connected to the telescope through the eyepiece holders

Telescope from  $f/10$  to  $f/17$

field :  $8 \times 8$  mm at  $f/17$

Loop at 100 Hz for objects with magnitude 5

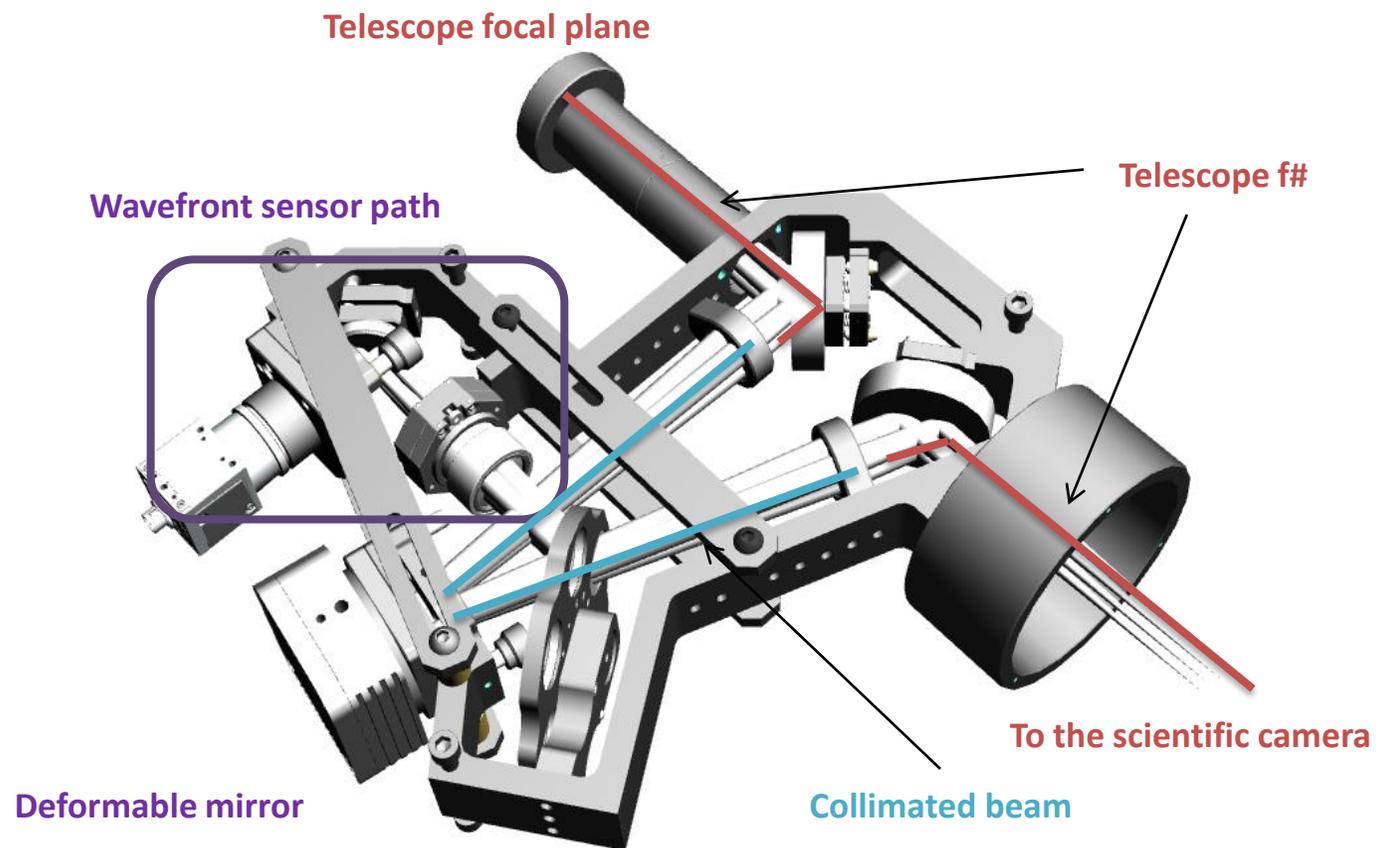

from 400nm à 800nm

Quick access to the deformable mirror and wavefront sensor

The user can choose between different kinds of beam-splitter

Allow the use of a filter wheel or ADC

No spec on the Strehl, let's just see...

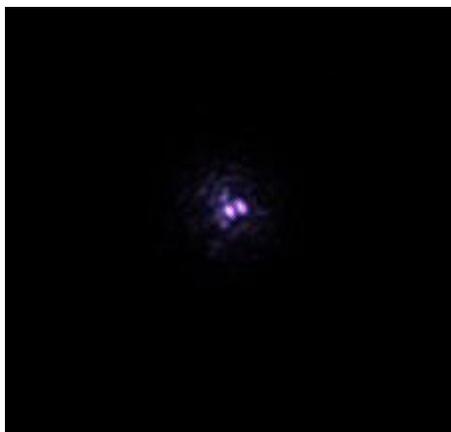

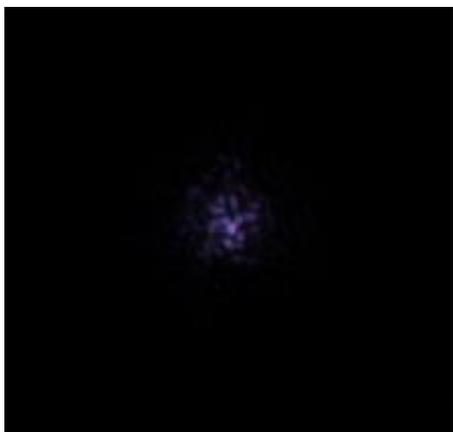

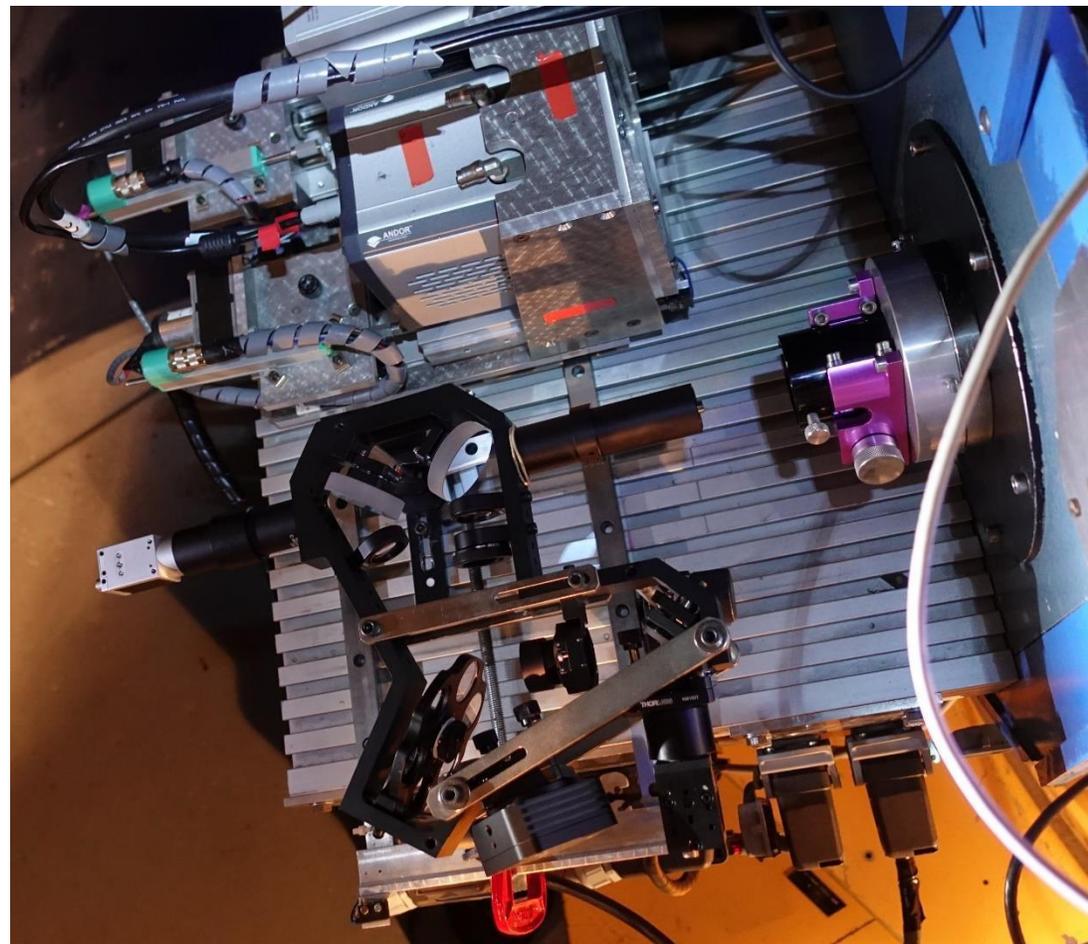

## The deformable mirror

- Monomorph piezo-electric with > 20 actuators
- > 1kHz
- 10 mm diameter
- < 15 nm rms WFE accuracy for low orders
- > 5 $\mu$ m PtV of curvature and astigmatism

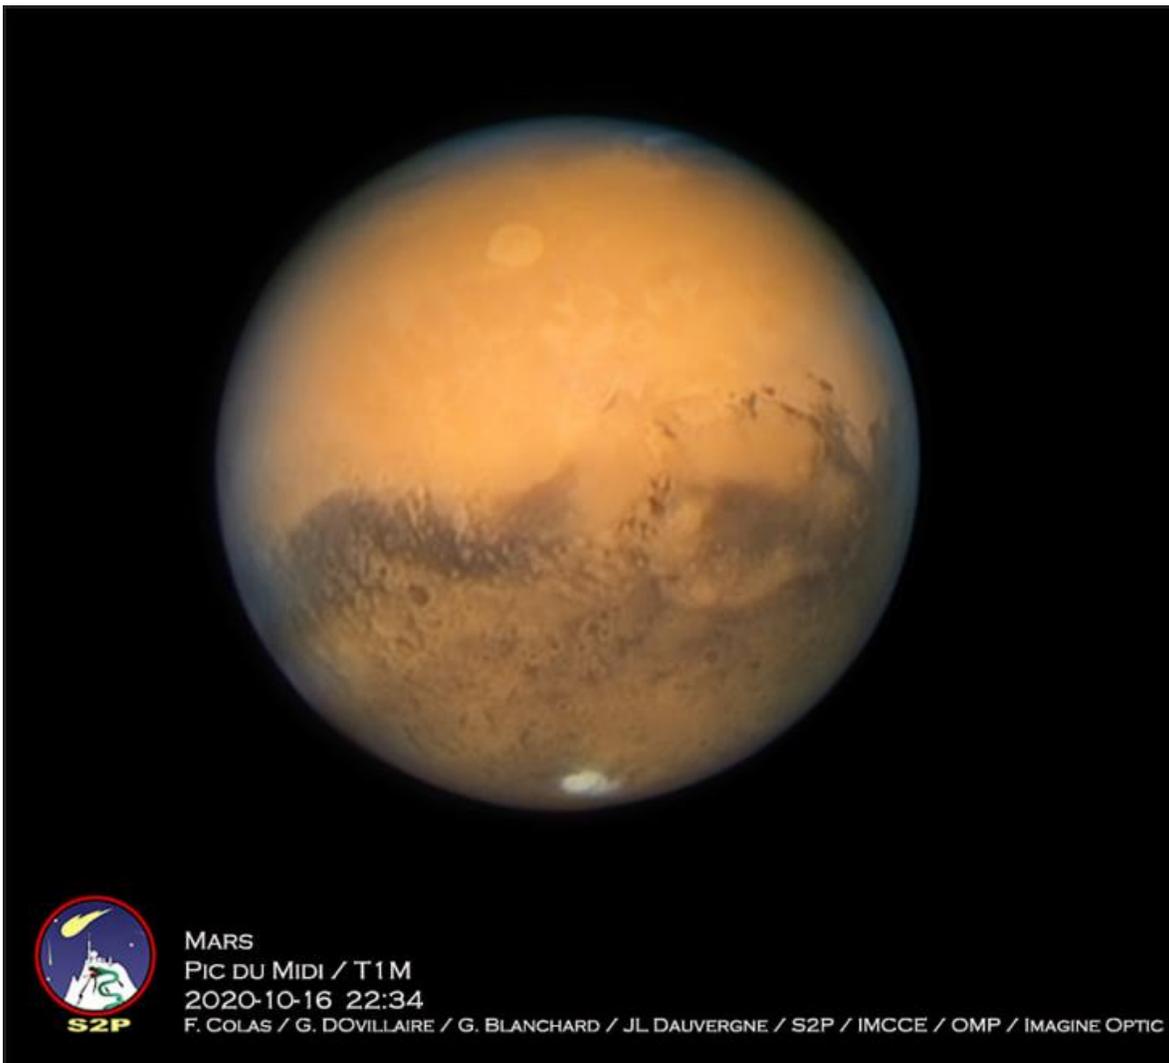

## The wavefront sensor

- Shack-Hartmann 11x11 microlenses
- 1.2kHz
- 20 nm rms accuracy at 5000 photons per microlens

# First light in 2017

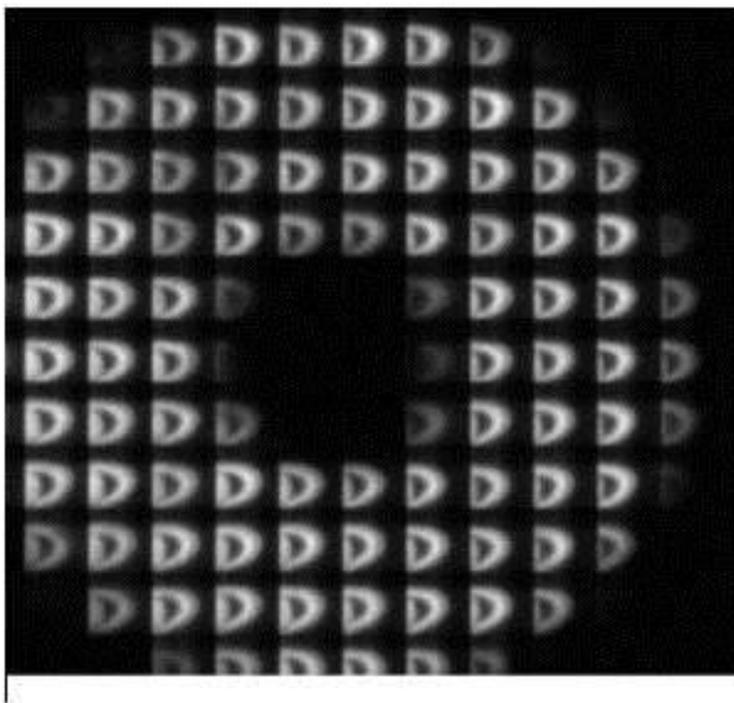

# Active optics mode in 2020

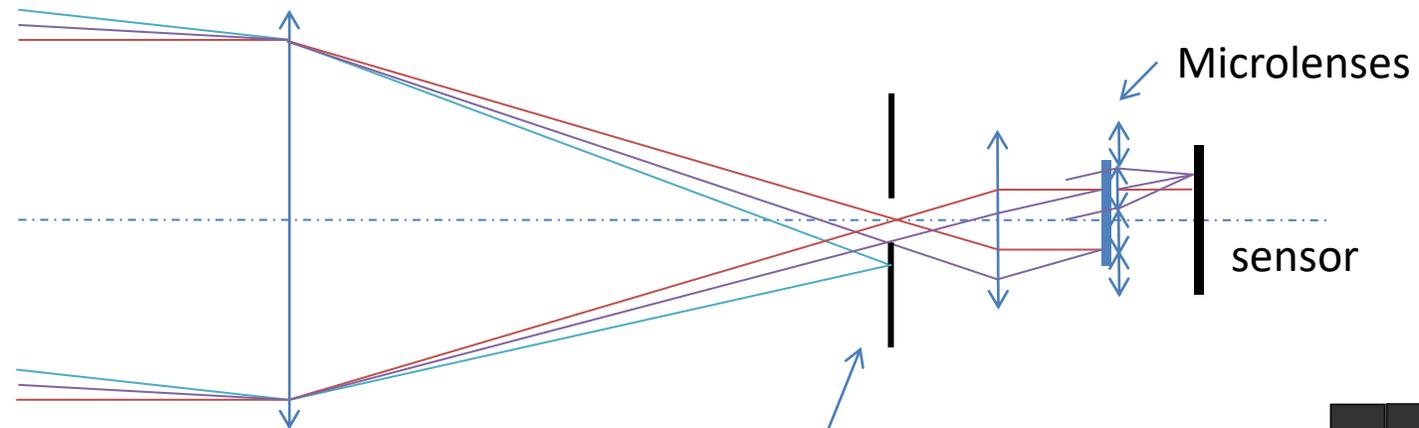

The most detailed image of  
mars acquired from ground ?

# When you aim a bright object such as Saturn

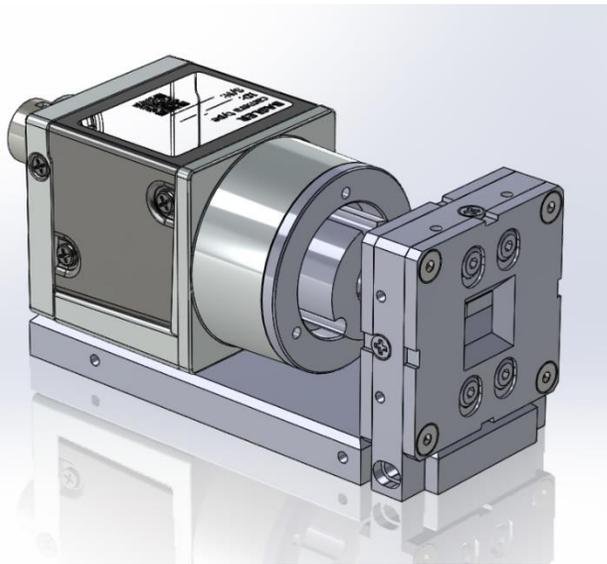

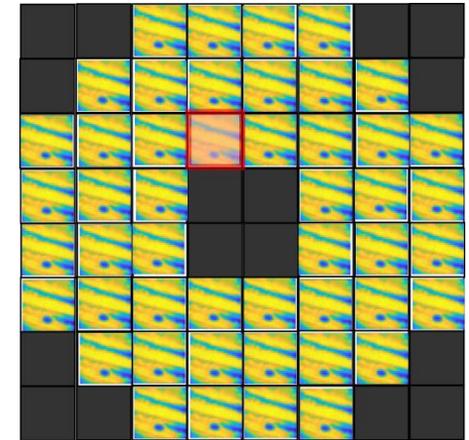

A standard Shack-Hartmann  
algorithm is not adapted

# An extended source Shack-Hartman: HASO WIDE

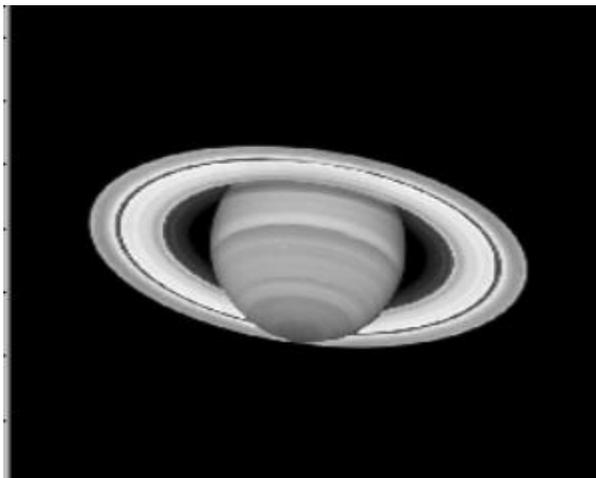

Field stop  
Limits the object size

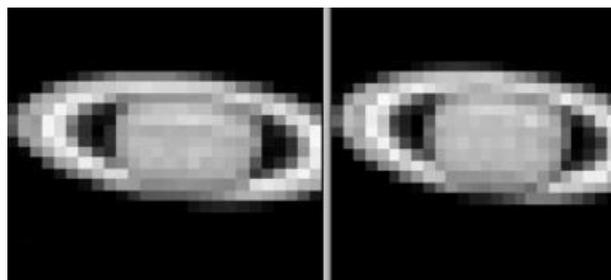

Sub-images are created on the detector  
The relative position of all sub-images contains the information of the incoming wavefront  
The field stop avoid the overlap between images

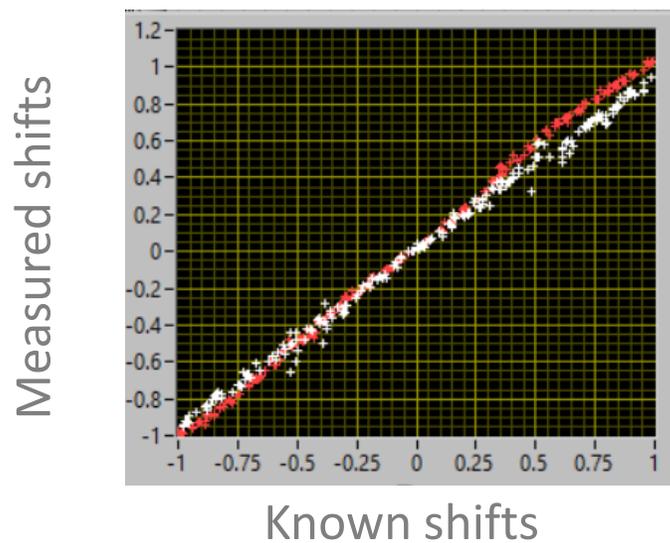

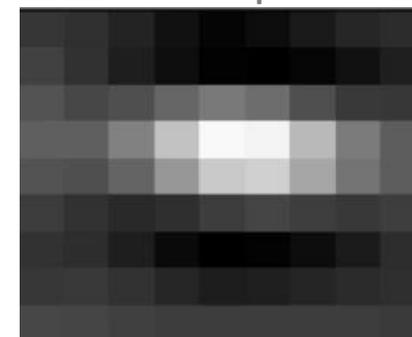

# Some simulations

Sub-sampling, Known shifts are added

Intercorrelation maps

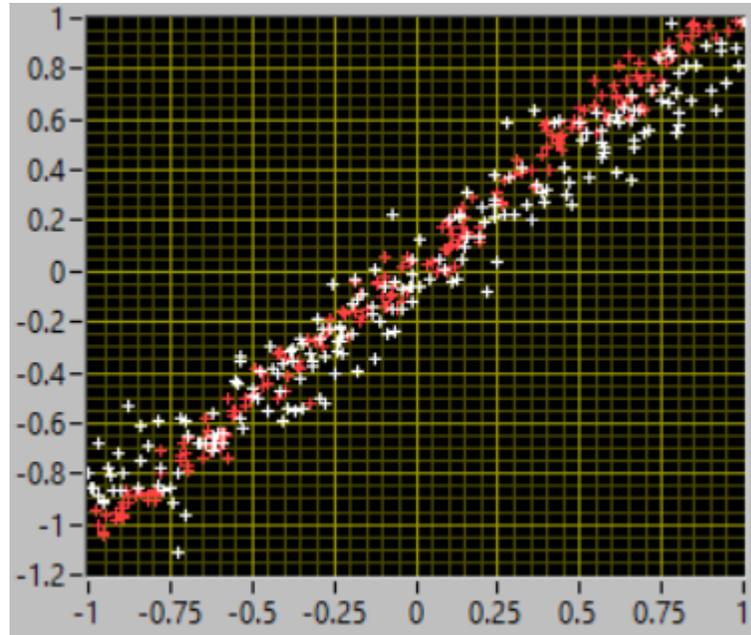

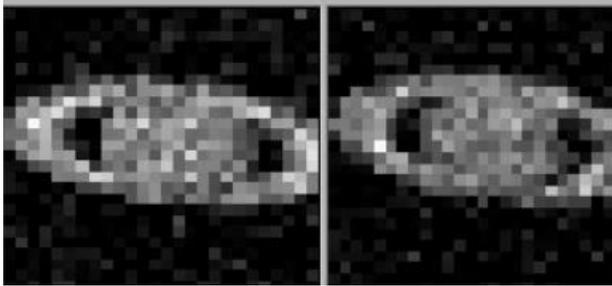

(in unit of pixel)  
X in white  
Y in red

Standard deviation is 0.059 pixels RMS

400 000 ph/microlentilles

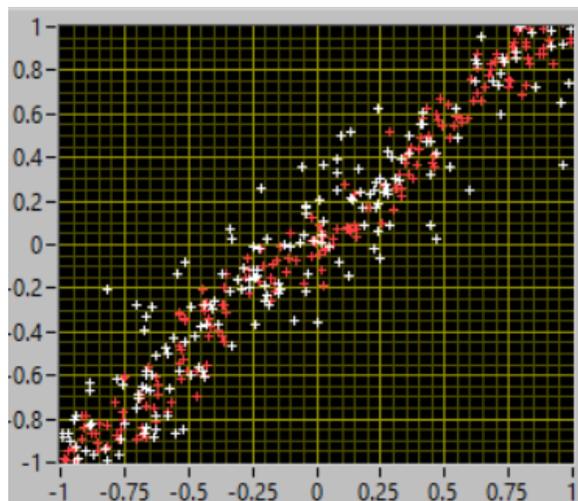

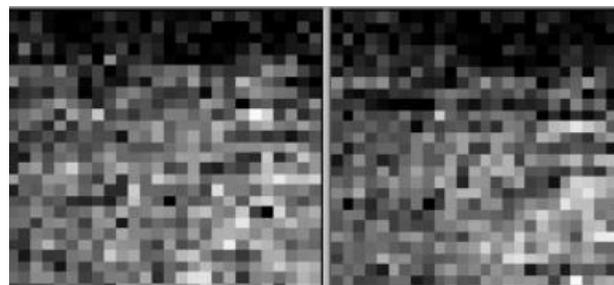

# Some simulations

10000 ph/microlentilles

Standard deviation is  
0.14 pixels RMS

# Some simulations

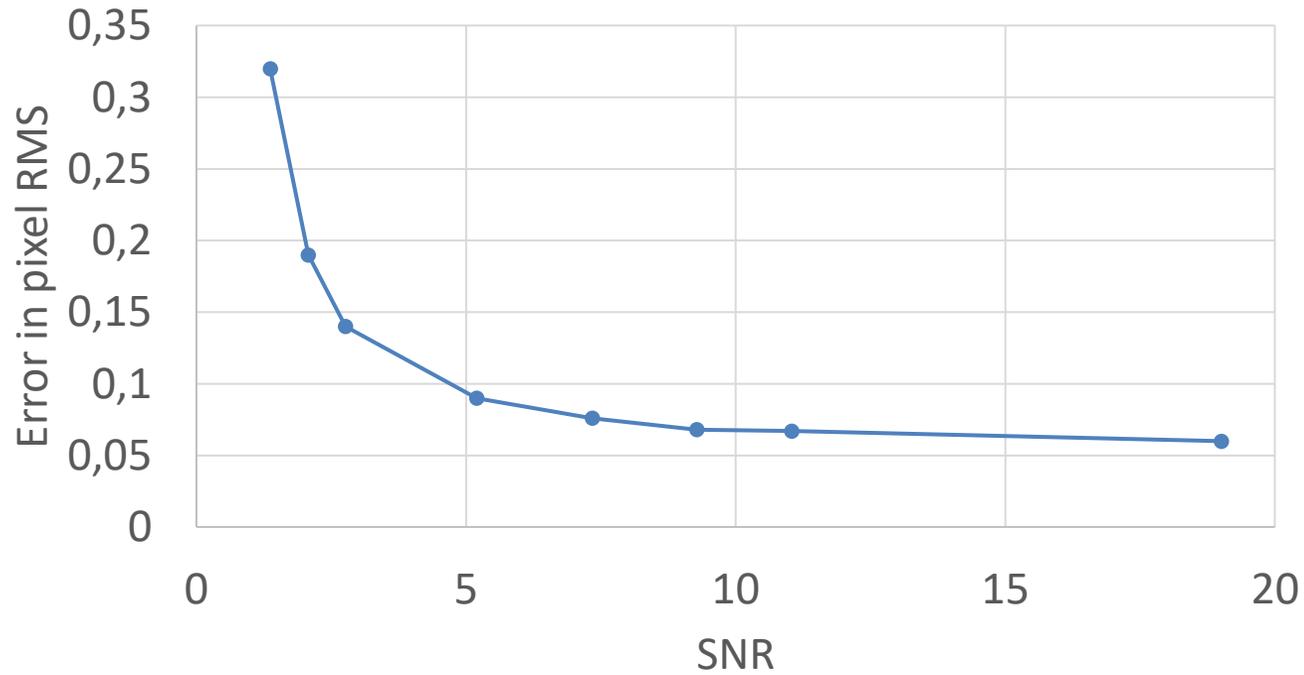

Standard deviation is  
0.24 pixels RMS

(20000 ph/microlentilles)

# Some simulations

Sub-images shifts accuracy

SNR

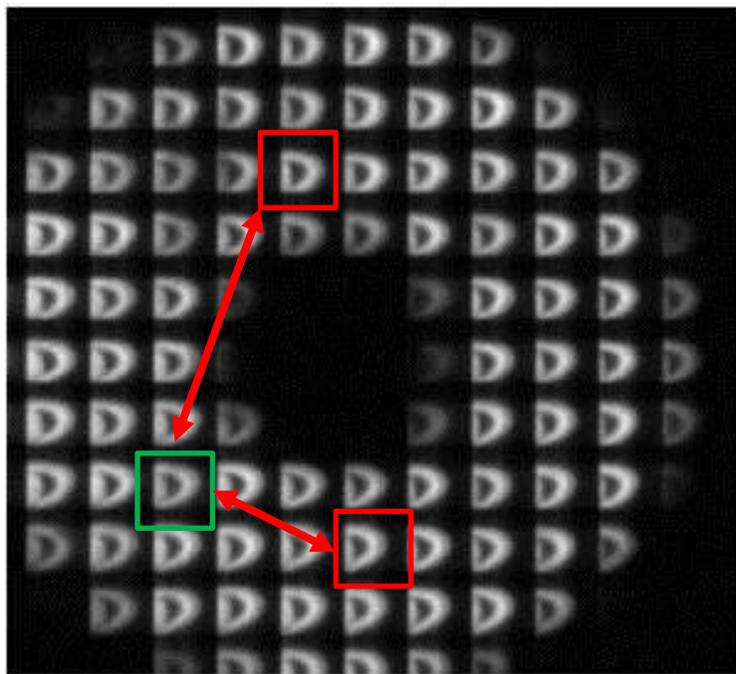

Spatial RMS of temporal  
means  
/  
Spatial mean of temporal  
RMS

Contrast in the image

Noise in the image

# The extended source Shack-Hartman: the tilt problem

## Spatial intercorrelations

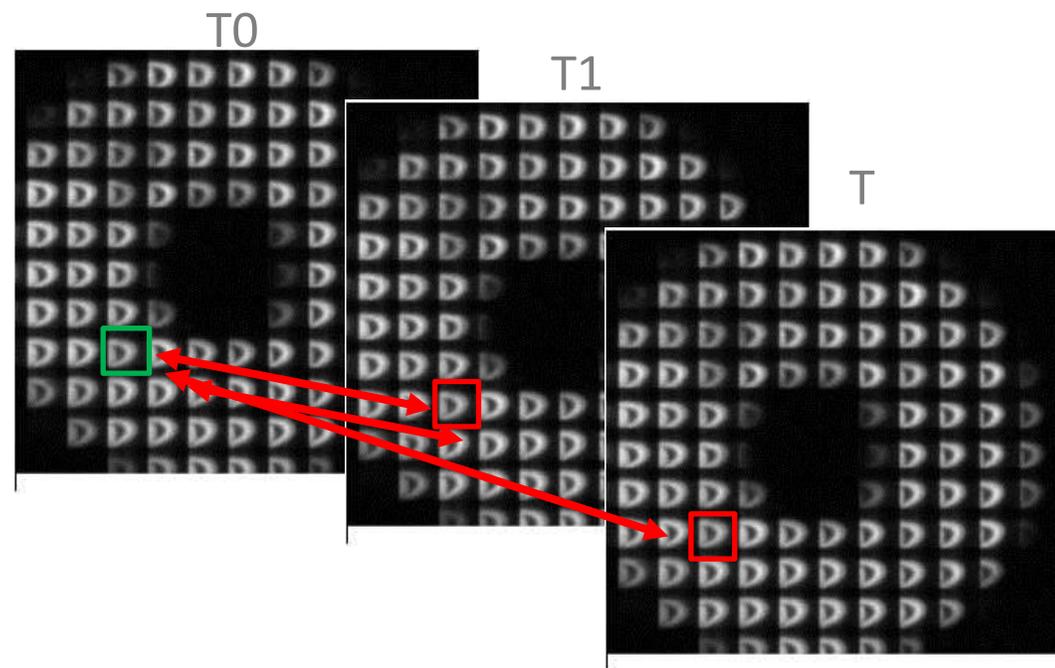

The reference microlens (in green) measures always tilt=0

→ The wavefront tilt is not measured

THEN

## Temporal intercorrelations

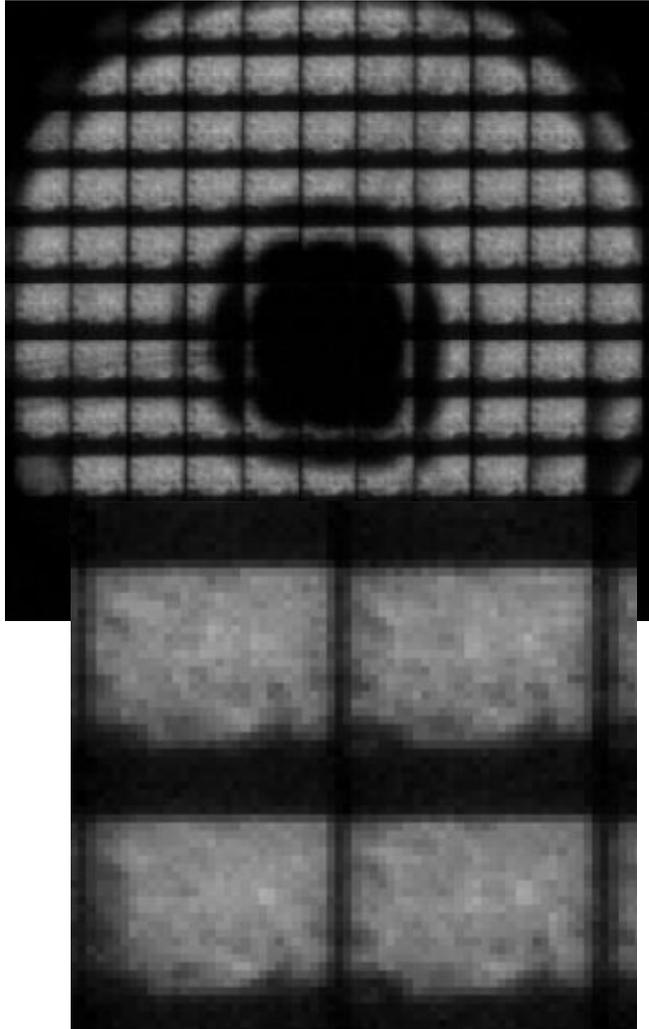

The first image is taken as a reference

→ The static aberrations are not corrected

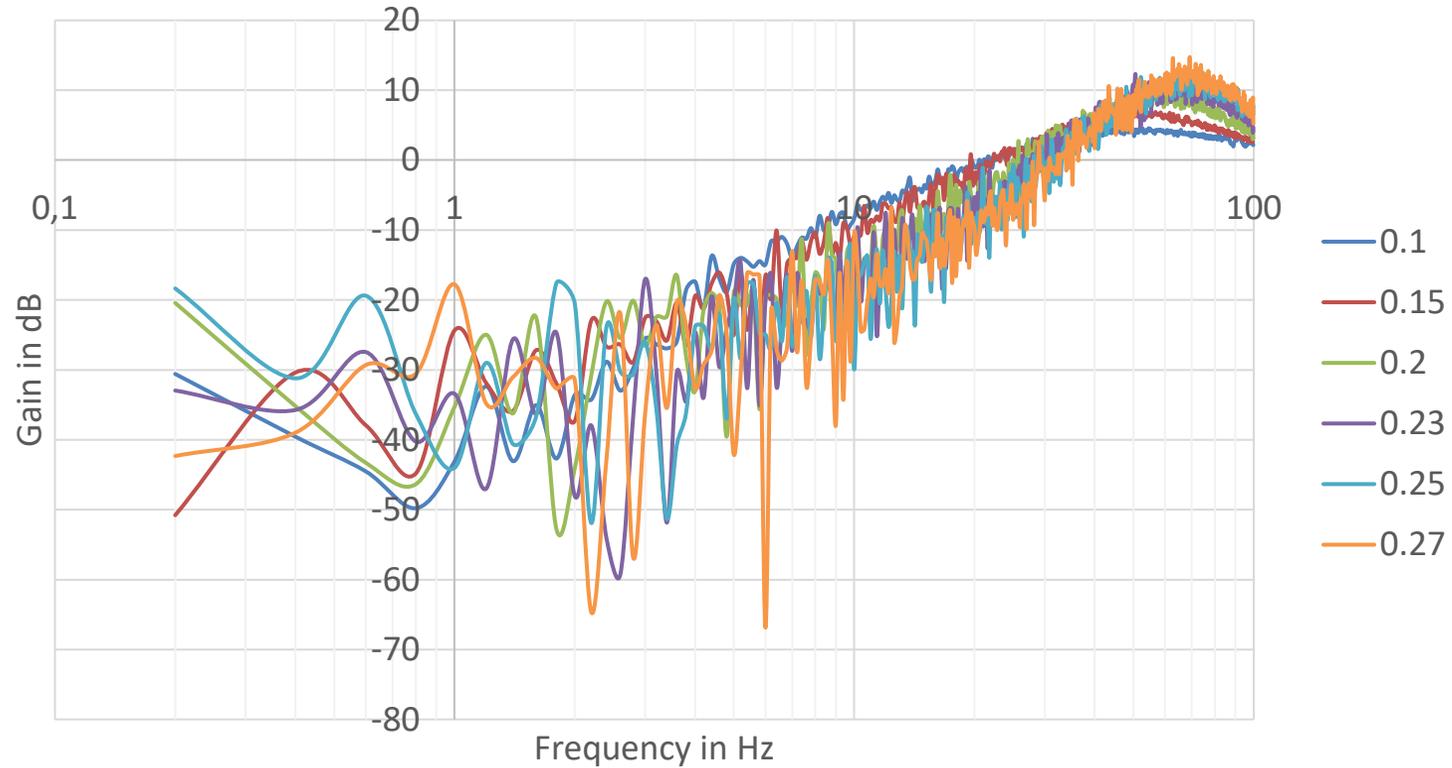

# In real... on the moon

Mewlon 250 + CIAO,  
2021-12-21, Paris

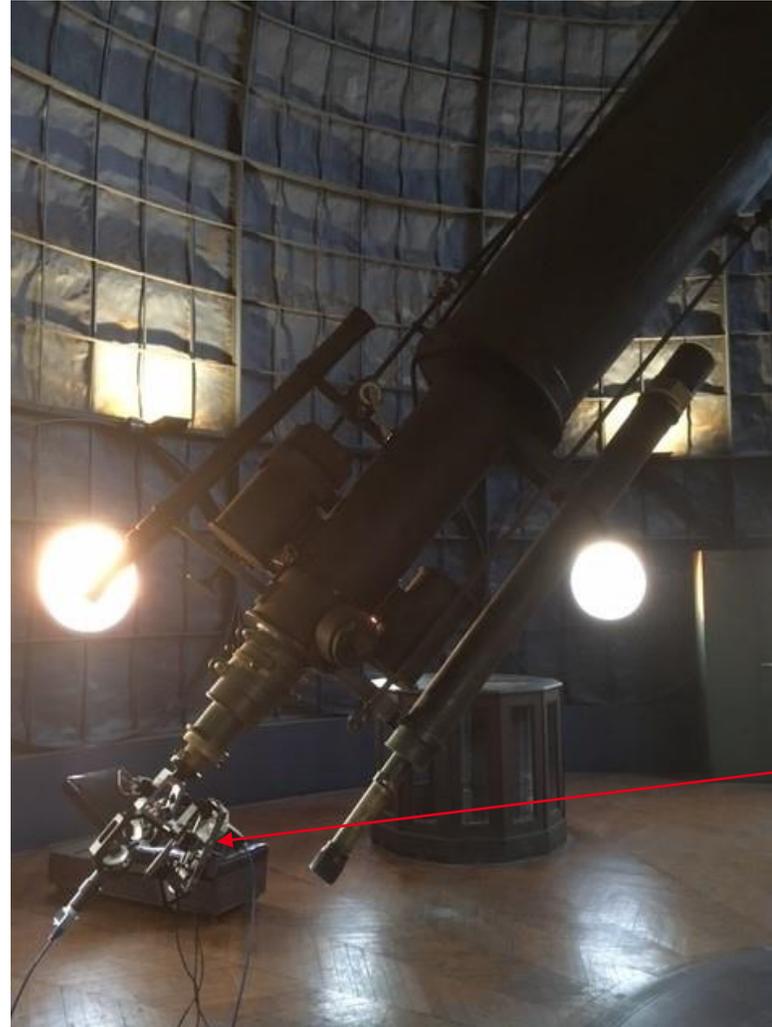

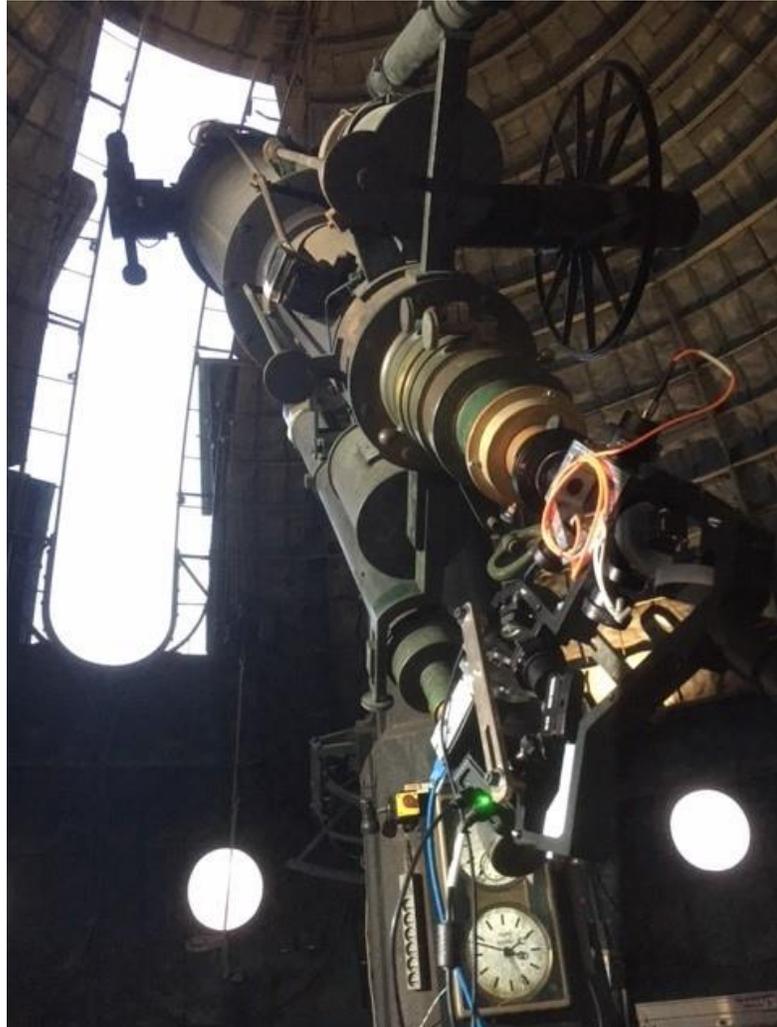

# Temporal performances

Measured rejection function for various loop gains, 30modes, 400Hz

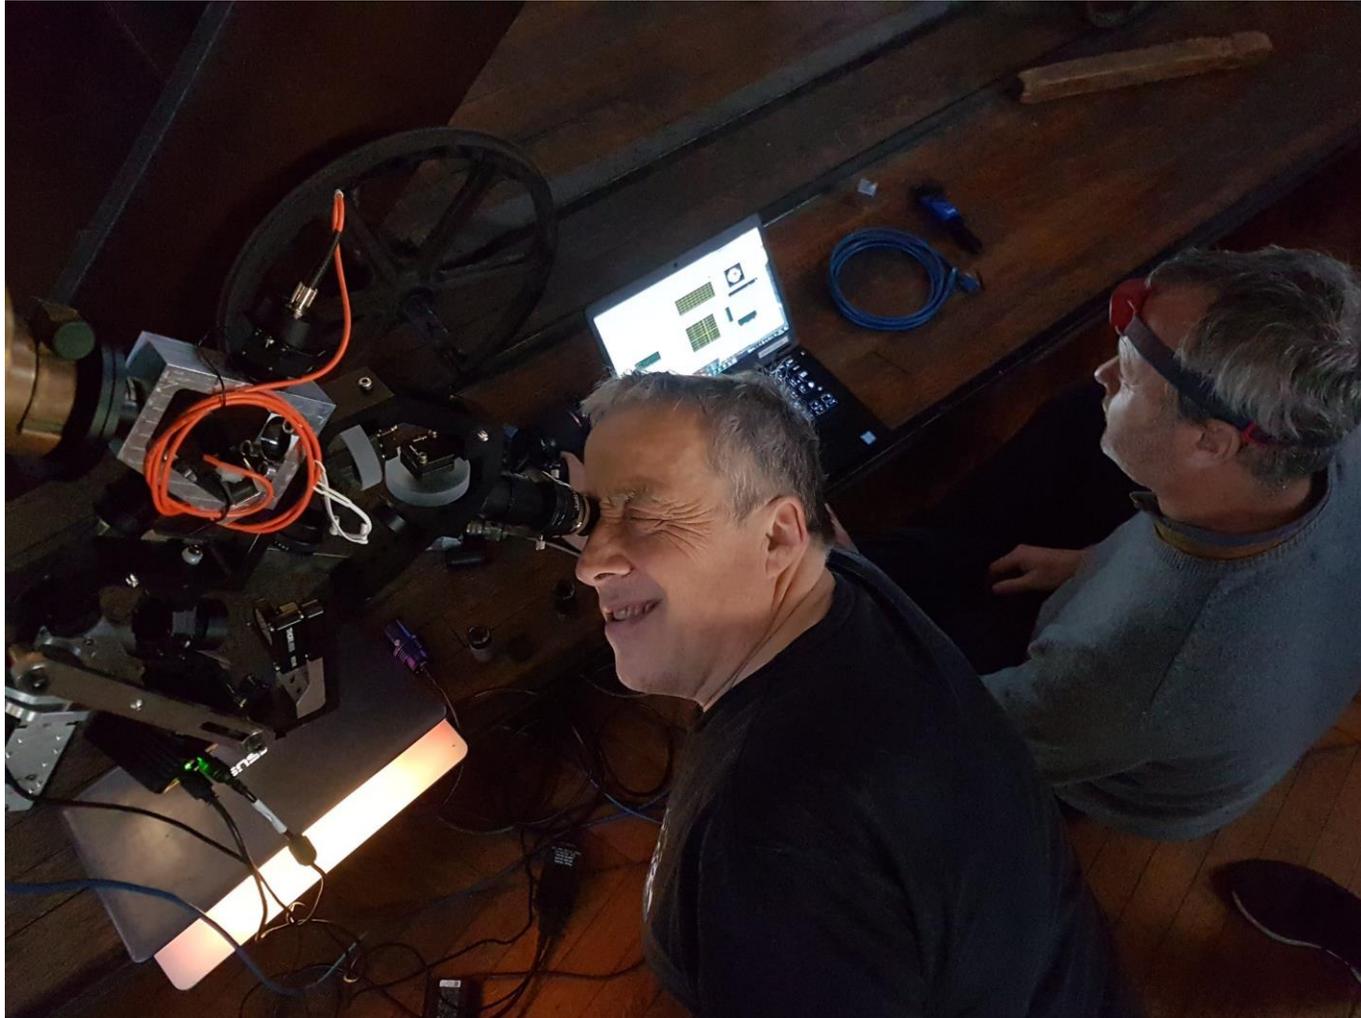

Let's have fun

The Arago telescope at  
Observatoire de Paris

CIAO
